

Dependable, Reliable and User Friendly Web photo server Supports both JPEG and TIFF, as well as the older TIFF4Net format User-friendly interface for anyone to share images with others Sharing with friends, coworkers, family and the general public Access to images can be restricted using a password that can be set as an administrator Works well on your home network, college network or corporate network Works both on a personal level or as a network server for small business Quick and Easy to Install. ImageBank Server Special Features: Extremely easy to install and configure Can be installed on a personal computer or as a network server Supports JPEG, TIFF and TIFF4Net image formats Consists of a simple, easy to use interface Support for shared files Sharing can be restricted using a password Sharing your images with others Support for web publishing, frames and many other web technologies ImageBank Server Professional Features: No annoying windows Accepts photographs in various formats Support for all JPEG, TIFF and TIFF4Net image formats Reliability User Friendly Highly Customizable ImageBank Server Specifications: Operating System: Windows Minimum System Requirements: Operating System: Microsoft Windows XP/2000/2003 Server, 2000/2003/2003(R2)/2008 Server, 2000/2003/2008/2008(R2) Hardware Required: Hard Drive Space: 1.7 GB Video Memory: 256 MB A Pentium II, 300 MHz or higher Serial Port: Required USB Port: Required Network Connectivity: Required Minimum Network Connection: Ethernet connection For more detailed information on how to set up ImageBank Server click on the following link: I have been using the server version for a few years now and it has worked great for my needs. There is one complaint I have that I don't see mentioned on your page - it is a memory leak. Although I am not a coder, I have downloaded the source code and can see that the problem is in the FileHandler class. It has a member variable called 'lastWriteTime'. This variable gets initialized to the current time on creation and is used in FileHandler.dll to determine if an image was updated. There 70238732e0

KEYMACRO is a script for creating macros in Excel, where macros can be triggered by a single keystroke. The user can set macros to a given key combination, and define rules by which the macro is triggered. Keystrokes can be assigned any event - mouse clicks, keypresses, scroll wheel movements, or even keyboard shortcuts. The only restriction is that the user must ensure that the macro won't be executed while the workbook is being manipulated. To ensure this, the workbook should have locked cells and the user must lock the sheet before running the macro. Features Start and stop a macro by a keystroke. Macro is automatically triggered when the macro is started. Macro cannot be run with locked cells. Macro has a help message and icon. Macro is automatically stopped when the macro is executed. Macro cannot be run again. Macro cannot be activated by user. Macro does not disturb other macros. Macro does not disturb other macros. Macro is automatically deleted when the workbook is saved or closed. Macro cannot run from the Macro dialog box. Keyboard layout is saved. Macro is saved in the Macro dialog box. Macro cannot be assigned to custom shortcut keys. Macro cannot be assigned to another keystroke. Macro cannot be assigned to any other keystroke. Macro does not disturb other macros. Keyboard shortcut keys cannot be disabled. Macro cannot be run from the Macro dialog box. Macro cannot be run from the Macro dialog box. Macro is not active in the Macro dialog box. Macro is not active in the Macro dialog box. Macro cannot be called without being started. Macro cannot be activated by user. Macro cannot be assigned to a custom shortcut key. Macro cannot be assigned to another keystroke. Macro cannot be assigned to another keystroke. Macro cannot be assigned to any other keystroke. Macro cannot be assigned to any other keystroke. Macro does not disturb other macros. Macro does not disturb
