Episode 3.3. To Kill a Mocking Girl. 1. Old and new relationships are examined as the girls try to pay tribute to . Some records attempt to enumerate the number of stars present in the night sky, which would be one of the most mind-boggling statistics for any object to which you could compare it. Star counts typically focus on either the Milky Way or the number of stars that are actually visible at night. If you look into the night sky, the number of stars you see depends on the time of year and location you are viewing from. The overall star count varies by region, for instance, since in the northern hemisphere, there are fewer stars visible due to the fact that the stars we see are farther away from us in the northern hemisphere than the stars we see are in the southern hemisphere. Unusually high star counts in the night sky. Craters are also visible, including Siret, or the Meteor Crater, which has been called the Grand Canyon of Arizona and a four million cubic-foot hole in the ground. The sheer number of stars and meteor craters in the night sky gives the night sky the title of being the most diverse place in the universe, said Michael Shara, professor of astronomy at Harvard-Smithsonian Center for Astrophysics, [...]. National geographic articles of interest. Reports of bizarre UFO sightings, spooky ghosts, intriguing mysteries and much more. The European Space Agency hopes that by analysing the first 300 km of the Moon's surface in this way, scientists will better understand the Moon's crust and subsurface. The Young Astronaut. The Moon is a ball, an orb, a satellite of the planet Earth, which takes an average of [...]. The oldest rock found on Earth was almost four billion years old. In fact, there were single layers of rock that were formed 4. As an example, because of the unique geology of Antarctica, the mountains of the ice sheet are the only places on Earth that regularly expose rock of different ages. This means that if you find a piece of rock that was formed from erosion of a different layer of rock, then you can estimate the age of that layer, because the rock from that layer should be closest to the Earth's surface. These layers are often full of fossils. However, geologists now also use other methods to determine the age of the rocks. Not all scientists agree that radiometric dating is the most
