Trigeminal neuralgia (TN) is the most common cause of facial pain in elderly patients and has a negative impact on their quality of life. 1-year microvascular decompression surgery (MVD) is the first-line surgical treatment for TN. The aim of this study was to investigate the correlation between preoperative clinical manifestations and postoperative magnetic resonance imaging (MRI) findings of TN, as well as the correlation between 1-year outcomes of MVD and postoperative MRI findings. Patients with TN undergoing MVD between June 2014 and June 2016 were retrospectively reviewed. Inclusion criteria were the presence of an isolated facial pain with a definite physical and/or mental

trigger, a neurovascular conflict, and neuroimaging and/or electrophysiological findings suggestive of TN. Exclusion criteria were a history of previous MVD or neurosurgery, co-existing major comorbidities such as stroke, or severe medical illness. Pre- and postoperative symptoms were assessed using a visual analog scale (VAS). Pre- and postoperative MRI findings were reviewed. In total, 31 patients with TN met the inclusion criteria. There were 17 males and 14 females, and the mean age was 66.7 ± 5.1 years. The VAS score significantly improved at the 1-year follow-up ($P = 0.001$). Pre- and postoperative MRI findings showed no recurrence of trigeminal ganglion in all patients, but one patient showed a new peritrigeminal venous conflict with new ipsilateral facial pain. Pre- and postoperative MRI findings in patients undergoing MVD for TN are correlated. Early recognition of symptoms and proper treatments for the trigger point can reduce the risk of

surgical complications and lead to improved outcomes.Q: Can the boundaries of a UIView be set to specific values in the interface builder? I have a UIView which is being added to the bottom of a UIScrollView. I want to set the top, bottom, left and right boundaries to be 50 pixels from the top of the UIView. Is there a way to do this 2d92ce491b
