A: Watch your Caps Lock. You have moved a function key into a function key position. 'print ("hello")' The expression is evaluated by evaluating each token in turn, from left to right, stopping when the result is a value or an error. In this case, the 'print' token has no value or error, so the expression immediately terminates and the () is never seen. (The () has no value or error since it doesn't contain any expressions.)

A: You have accidentally put a function-key (Fn) key into a control-key position. The reason for this is because you've set up your keyboard with most of your function keys being mapped to control keys, and F12 (which is what that key is) is not a function key. If you're new to computers and keyboard shortcuts, I suggest not assigning these to anything at all, because you will probably be sorry you did. A: The first error you mention is because there is no such function in Python. You likely mean something like print(). Your other error is a similar one: None has no such method as get() (which may be the cause of your other error as well). Your third error is very easy to fix. You are not allowed to call methods on None objects.

Hematopoiesis and cardiovascular disease: lessons learned from animal models. Experimental models have been invaluable in studying the effects of hemodynamic force on hematopoiesis and the contributions of bone marrow to non-hematopoietic organ functions. These models include the developing heart, small and large vessels, vascular access devices, and the microcirculation. There is an extensive literature

demonstrating that hemodynamic forces generated in early fetal life are the basis for hemopoiesis in the adult. In addition, a review of more recent literature suggests that the myeloid, erythroid, and megakaryocytic lineages may be derived from hemogenic precursors present in the vascular and extravascular compartments of the neonatal heart and lung. Moreover, hematopoietic progenitors appear to migrate into the extravascular compartment of these tissues and contribute to the capillary bed. Thus, the early beating heart is a multilineage organ and hemodynamic forces produced by the heart are responsible for the generation of many other cell types. Category: News
