SAP HANA (aka HANA) is a powerful columnar storage engine that delivers.Q: Is it possible to make to move my car using my car key, like this? Let's say I have a car that has a door that won't open and a door that will open. I have a key to the car that is labeled with my name. My car key opens the door that won't open. Let's also say that the car has a tracking device. Can I make my car go to the closest garage to my location using my car key to start my car and the tracking device to tell me where my car is? Is this possible? A: In theory this is certainly possible, but there is a risk of irreparable damage to the vehicle and it is highly illegal. In the USA this is controlled by the National Highway Traffic Safety Administration (NHTSA) and it is illegal to attempt to control the vehicle under certain circumstances. Keyless cars (and even vehicles with keys) are regulated by the Society of Automotive Engineers (SAE) and the National Institute for Motor Vehicle Safety (NIMVS). Neither of these organizations allow for the kind of remote control you are describing. There are other reasons for this. For example, if someone else were to borrow the car, there are programs in place to allow you to remotely lock the vehicle, preventing them from operating it without your consent. For keyless systems this is accomplished by locking out the remote key fob or even locking out the vehicle with immobilizer. The immobilizer is a sort of death switch that can be activated by the wireless remote fob or even the fob in your pocket. For this reason it is illegal to operate a car that you do not own. It is also illegal to cause a vehicle to move from one location to another without being properly registered with the state and federal governments. A: You can do this in principle, but in practice it's impossible.
