Free Download IFRS DesktopStimulation of the colonic motility by EDRF-derived NO, a phenomenon of cholinergic neurons. The aim of the present work was to study the influence of endogenously released nitric oxide (NO) on the distal colonic motor activity in rats. Contractions induced by electrical field stimulation (EFS) in the longitudinal muscle layer of the distal colon were determined by means of isometric tension recordings. In all experiments subepithelial mesenteric artery (SMA) pressure was monitored to determine the intraluminal blood pressure. NO released by the rat distal colon was studied by means of the NO-selective fluorophore DAF-FM DA. NO-producing neurons were found in the myenteric and submucosal plexus and were modulated by nerve stimulation. The number of motor units was significantly lower in preparations with than without tetrodotoxin (TTX, 10 microM). In contrast, in preparations without TTX, NO-release by distal colon elicited a significant shortening of contractions to EFS, an effect that was abolished by NG-nitro-L-arginine (L-NA, 50 microM). Indomethacin (1 microM) abolished the contractile response to EFS in the distal colon. We conclude that EFS of the distal colon elicits a contraction and that NO is a mediator of this response.Q: Jinja filters and MySQL Trying to connect to mySQL from my python code using mysql connector I get this error. com.mysql.jdbc.exceptions.jdbc4.MySQLSyntaxErrorException: Table 'MyDatabase.users' doesn't exist This is the code: >>> a = open('customerdata.txt') >>> data = [] >>> for row in a: if "CustomerID" in row: data.append(row) >>> a.close() >>> form = SQLFORM.factory(db.define_table('users')) >>> form.mysql='MyDatabase' >>> form.customer = 'any' >>> form.sql_define() After defining the form I query the db
