When you use the most popular and highly regarded image editing program, you automatically get the most images if you want to edit even more images. Mingling with Printshop The Printshop application, available for both Mac and Windows users, works like Photoshop but is more geared toward printing. It doesn't have a layer-based editing system, but instead has a page-oriented workflow, which enables you to create pages out of individual images. Figure 8-5 shows the Viewer window in Printshop, which enables you to select, edit, and preview your images. The first step in using Printshop is to open an image in the Viewer window. From here, you can crop the image to remove unwanted areas and take a closer look at the details. You can also see if the colors, exposure, and other image attributes are where you want them. **Figure 8-5:** PrintShop enables you to view, select, and edit your images. After you've viewed the image, you can adjust the image size, color, and toning by selecting one of the tools in the Toolbox. Figure 8-6 shows the Toolbox in PrintShop. **Figure 8-6:** PrintShop provides the tools for making adjustments. Figure 8-7 shows a sample adjustment made with the Tonal Balance tool, which adjusts colors and toning in the image. The colors are brightened with warm colors (100 degrees) and the tones are softened (50 degrees). With the Tonal Balance tool selected, place your cursor over the image and drag the tool to the area you want to apply the adjustments. The Tonal Balance tool automatically selects the surrounding colors to balance the color of the area you select. You can also make adjustments to the color, exposure, or tone using the Adjustment panel. **Figure 8-7:** With the Tonal Balance tool selected, place your cursor over the image and drag to the area you want to make adjustments. PrintShop also offers an interesting feature that enables you to apply a color correction curve. The Curve dialog enables you to define your own color correction curve that can be applied to a range of colors and images. With PrintShop, you must first select the Image Spot Colors tool (located in the Tools panel) before you can use the Curve tool. In addition to adjustments that you make using the tools in the Toolbox,

Inhibition of CFU-E, CFU-GM and CFU-GEMM by novel thiosemicarbazone analogues. A series of thiosemicarbazone analogues of interleukin-2 (IL-2) were prepared and their inhibitory effects on CFU-E, CFU-GM and CFU-GEMM growth were evaluated in vitro. 2-[(4-Amino-5-methylthiazole-2-yl)imino]acetate (BMT-1) and its 3-methyl derivative, 2-dimethylamino-3-[(4-amino-5-methylthiazole-2-yl)imino]acrylate (BMT-2) showed the most potent activity. The inhibitory effect of these compounds was also confirmed by the effects on colony numbers of IL-2-dependent cell lines. Compound 2-(3-amino-4-methylthiazole-2-yl)-N-phenylthiosemicarbazone (BMT-3) was also evaluated. Inhibitory effect of pentoxifylline on production of tumor necrosis factor- α and interleukin-6 in lipopolysaccharide-stimulated human monocytes. The effect of a methylxanthine derivative, pentoxifylline (PTX), on production of tumor necrosis factor- α (TNF- α) and interleukin-6 (IL-6) in human monocytes stimulated by

LPS was investigated. The production of TNF-alpha in LPS-stimulated monocytes was considerably suppressed in the presence of PTX, and the suppressive effect of PTX was paralleled by that of a well-known protein kinase inhibitor, staurosporine, but not by PD98059, an inhibitor of extracellular signal-regulated kinase. The production of IL-6 in LPS-stimulated monocytes was considerably suppressed by treatment with PTX, but not by staurosporine. The suppression by PTX of LPS-induced TNF-alpha production was closely correlated with the kinetics of cyclic AMP accumulation in monocytes. These results suggest that PTX blocks LPS-induced TNF-alpha production through inhibition of cyclic AMP-dependent pathway. However, the extent of the suppression of LPS-induced IL-6
