WAMer is a simple and powerful program for the simulation of gas-dynamics circuits and the prediction of the flow of fluid and chemical species. It is a great tool for simulating the operation of internal combustion engines. It is suitable for professional designers and does not require any knowledge of programming. - Natural flow This is a package contains 2 new projects. This one (L_N_E_R) (SRILAM) and the one (L_C_E_T) (OPRIMA). Both projects have the SRS files where you can download them. I have no idea how to keep the files structure different... So they are well... SRS files. If you need some help or info, just ask. Live nuke 3D web-demo is a PHP/MYSQL based simple web site, containing series of 3D simulated nuclear explosions. You can see bombs going off and sky sceneries. You can also control speed and direction, like setting laser for a target, or setting a focus area. You can zoom in and out and adjust 'terrain' levels. You can view bombs when they explode, you can also interact with the bombs, but that's not all. You can also add your own models to the bombs and see them explode as well. You can set color for all colors and borders, and set a target time of your own. You can even use the site as a fire-work stand for fireworks. Website is still under construction and should be done in near future. Just another application for SoftPico Simulator. Use this application to draw the current state of your circuit. When simulating a circuit with SoftPico Simulator (or any other simulator) you have to get into the manual mode and connect each of your components manually with wires. This software generates a live Pico-simulator in your softwares' window, which you can use to inspect your circuit's electrical state. For this application, each component is stored as a data structure in your hard drive. This data Auto Body Lab is a simulation engine for displaying a real time collision simulation of an Auto Body / Auto Crash. There are still missing components so currently only vehicles that are auto-bodies will be displayed correctly. The collision detection is done in real time, meaning that if the simulation crashes, it will crash the game. P

What's New in the?

WAMer creates flow models with up to 500 cylinders. It is a compact application (64MB) and you can run it in a fully offline mode. It will generate several output files, allowing you to export the design to other applications and share it with other users. WAMer makes a fully interactive model with a zoomable three-dimensional map, fluid and pressure sensors. It has a simulation mode to run the model with the live values. WAMer includes multiple modeling options to make you a certified gas dynamics engineer and a digital engine designer. WAMer has a powerful fluid simulator (Bubble) with several attributes to control the simulation, coupled with a powerful solver (Bullet) for fluid/thermodynamics simulation. WAMer includes a powerful interactive GUI, simulation status information (SimStat), and a full-fledged view/modeling workspace. WAMer is designed to be a digital engine designer. All parameters can be adjusted from the Design workspace. When WAMer is installed on a Microsoft Windows PC, all of the file and the calibration information of your engine, fuel and airflows will be saved to an XML file called steamwam.xml. This file can be loaded again by reinstalling WAMer. WAMer is a user friendly tool designed for engine and ship designers. It makes your life easier by simulating the flow inside your engine and predicting the thermodynamic behavior of your engine. Your engine can be a car, a truck, a boat, a bicycle, etc. To complete this simulation, you have to simulate the cooling and exhaust. WAMer includes exhaust simulators (Exhaust Kit) for WAMer and you can create and simulate a hybrid engine with more than 500 cylinders. It is the most powerful engine modeling tool. WAMer is now available for Windows XP and Windows Vista. WAMer for Windows 7 will be released later. There is a new version (3.4.1) released on 8/21/2012, please check the web page for more info. If you have any question, please email us at support@steamwam.com or send a post on this forum. ===================================== Portsmouth Portsmouth is a user-friendly, cross-platform software package designed to model mechanical/electrical systems such as aero engines, propulsor engines, wind turbine and electric drivetrain components (electric motors, linear and rotary actuators, control/sensing electronics, etc.). This includes both mechanical and electrical analysis with the ability to calculate net power and torque.
