The ability of pulsed electric current to produce changes in living and nonliving materials is explored. When applied to living tissues, effects include increased intracellular Ca<sup>2+</sup> activity, changes in membrane potential, and electrochemical reactions such as chemical and enzymatic modification of proteins and DNA. The results suggest that electric fields associated with different pulse parameters may be used to manipulate the shape of cell surfaces, alter the permeability of the membrane to molecules, and alter the internal chemistry of the cell. The mechanisms of these effects are discussed in terms of the relevant physics and chemistry of nonpolar and polar liquids and gases in electric fields, the mechanisms of transmembrane current flow, and the alteration of the electrical properties of cell membranes. Over the last week, we've seen two major reports that, if they're accurate, throw a new light on an issue that's been largely overlooked by mainstream historians: the true nature of the Inquisition. In all fairness, as a historian, I don't think it's healthy to accuse people of a century-old crime they didn't commit without proof. But, based on a variety of evidence, these reports leave little doubt that the victims of the Spanish Inquisition weren't "obscure Jews," nor were they "witches" -- the heinous caricature of them used by the popular press to this day. They report that the victims of the Inquisition were simply people who were wrongly accused. The sordid history of the Inquisition is well known. Since the Middle Ages, the church and the state have gone after people they believe to be witches. According to the Catech
