Thirty patients with vertigo of an unknown etiology were evaluated for the presence of vestibular disorders, peripheral vestibular disorders and central vestibular disorders. All patients received treatment with flunarizine, a calcium entry blocker, in an attempt to control their symptoms. After 4 weeks of treatment, 43 per cent of patients showed dramatic improvement; this figure increased to 70 per cent after 6 weeks of therapy. No significant side effects were observed. We conclude that flunarizine is a safe and effective drug for the treatment of vertigo of an unknown etiology and we suggest that it be considered as the first-line therapy of this disorder.
