The program allows you to move your data from one computer to another, e.g., from Windows to Mac and from hard drive to USB stick. It’s possible to copy files over a network and retrieve them later, e.g., after reinstalling Windows or a new router, and the process is highly safe because the data is transferred in encrypted form. As soon as the file is transferred, the program automatically starts a new process. You can, of course, stop it at any time. Even after you have finished moving your files, Onedrive keeps the original data and leaves a duplicate on the destination computer. Therefore, if you need to back up files, you can rest assured that there will be no harm done to the originals. Ease of use, powerful encryption The program allows you to use the transfer function in three ways: to back up the data to a USB flash drive, cloud drive, or online storage service such as Onedrive to back up the data to a network share (network folder) to copy the data between two computers A user interface similar to that of the original Windows Explorer lets you move files in a few mouse clicks. Besides, you can copy and move large files in high speed, which is why it is said to be among the fastest file management programs of its

kind. The program supports all major operating systems and also provides file search, duplicate detection, and filenaming. The interface is easily accessible with tools that make it easy to navigate and find the content you want. Moreover, encryption of the files being moved ensures that they will be safe and will not be available to prying eyes. Transferring files from one computer to another is easy, and you can, if need be, specify the files to be included in the process, make the transfer bidirectional (the program transfers only the parts that are missing on the source or destination computer), or exclude particular files from the transfer. The program supports most common file types and allows you to back up data from
