When decrypting the decrypted data with the same set of keys the data output is empty. I am able to decrypt the data using an AES Key and Cipher mode of CBC. When we encrypt the same data with an AES Key and Cipher mode of CBC we get encrypted data as shown below. Here I am using MD5 as symmetric crypto and SHA256 as message digest. The plain/clear text is "Galaxy S5" and the encrypted text is "xk69dsgw2jx2afu3a2nk9cl45c4onX6v94ys22iqry4c1hi5vyauu9n6tzrk4ni4a23ia8". The actual encrypted/decrypted data is as follows : "VfK6E+/m7/h+z0cx+9+8mw=" So at this point, we know that both the operations are correct. Now I encrypted the same message with the same Keys and Cipher Mode as CBC but with a Message Digest of SHA256 The plain/clear text "Galaxy S5" and the encrypted text is as below : Encryption is successful as I am getting output as "QJd6LCVkdG3MSkJxlUyujqN2gme=" but when I decrypt the encrypted data with the same set of keys the decrypted data is

coming out to be an empty string. Here are the code snippets which I have used : Android Code Snippet: Decode : cipher =

Slices a selected region out of a photo and replaces it with another image. This image can also be resized to make it fit its original area. It can be done either in real time as soon as a modification is applied to a photo, or after creating a new layer for the final outcome. Cutout supports more than 10 different paths (eg. Rectangle, Parabolic, Slicer, Antialiased, etc) and more than 10 different cutout effects (eg. Eraser, Fractal Fade, etc). You can cut out various regions of a photo, leaving the rest of it intact. The cutout effect itself can be applied in several ways: as a normal overlay, as a normal layer, as a new layer or as a pattern overlay. Right-click the photo, paste a pixel path and the cutout effect you want to use in the General dialog window, and Cutout will do the rest. You can also access all Cutout options using a separate dialog window. A few options let you change the aspect ratio or resolution of the final cutout photo, and save its new state. And when you apply a cutout effect that's set to "normal layer", the altered area is accessible via the layer thumbnail at the top of the main window, so you can easily position it on the photo.
