=============== Clean Ram Cracked Accounts is a very tiny program intended to allow you to process some very high consumption processes from RAM (which will have an impact on your system's performance). This is a very helpful piece of software for Windows XP users who are experiencing a slow response when using their computer. In addition, it's a useful tool to improve performance in particular programs (e.g.: your browser, a game, etc). Clean Ram is the result of a project dedicated to the improvement of Windows XP's performance and comprises three simple tools: A RAM reclaim, A memtest, and a startup timer. The goal of this application is to help you improve your computer's performance, and if you're a Windows XP user, you know how important it is to improve it. Why Clean Ram? ================== Clean Ram will improve the performance of your Windows XP system in two ways: By reclaiming the RAM which is no longer being used. By automating the process of testing your system's performance. How Does Clean Ram Work? ========================== Clean Ram works by pre-allocating a small amount of RAM for itself. Once Clean Ram detects the amount of RAM that is available, it is then allocated a fixed amount of RAM that may or may not be enough for it to operate normally. This RAM amount is set in relation to the amount of RAM which is available on your computer. In fact, depending on the amount of RAM that is available, the memory you have reserved for the application may already be enough (or may not be). The allocation of the memory is repeated every 30 seconds for the period of 30 days. If Clean Ram detects that the amount of RAM available has changed, it will automatically adjust itself to maintain a constant amount of RAM for it to operate normally. Please note that the allocation of memory may result in the application moving to the background. Clean Ram's RAM Reclaim ===================== Clean Ram begins by testing if the RAM which is already available can be reclaimed for other processes. After verifying that this amount of RAM is available, Clean RAM will then attempt to reclaim some RAM for itself. The amount of RAM that can be reclaimed is initially calculated in relation to the amount of RAM which is reserved for Clean Ram. In other words, if you have 1GB of RAM available, Clean Ram will use 0.05GB of this amount for itself. In this way, Clean RAM is able to reclaim RAM that is not being used by other programs
