## Windows 7 Sp1 X86 X64 [AiO 11in1] [Iso - Ita]

I am looking for an automated way to get this info. I want to select x86 and x64 versions separately, and change the \ to the iso-filename. I tried (at least, i guess i was trying) something like `find /aip/ -name *.iso` but it returns a lot of things with iso files in them. `find /aip/ -name "*.iso"` returns the iso files, but doesn't return the program that contains it. How can I make find print only the files that contain the.iso file in them? A: As of find command with GNU find: `find /aip/ -type f -regex '.*\.$'` You want to match files whose name ends with.iso. With `-regex` this will match regular expressions instead of files. Combined with `grep`: `find /aip/ -type f -regex '.*\.$' | grep -v grep` This will only print matching files that don't have `grep` in their name. Or if you want to use `grep` in the same line as your `find` command you can use this: `find /aip/ -type f -regex '.*\.$' | grep -vf find.out` But note that this is quite tricky and will create hard-to-read output. If you just want to list names of files with.iso extension in the current directory you could do it this way: `for i in *.iso; do cp "$i" "$i.iso" done` Or use wildcard expansion in shell glob, as was answered before: `ls **/*.iso` or use `find` with `-iname` instead of `-regex` option: `find /aip/ -iname '*.iso'` Update As for your question about.iso and.iso.iso You should know that the way how it's interpreted depends on your operating system. Most often the file is interpreted by a file system tool. On Unix-like systems that file normally has no extension and the shell will interpret the name before it's passed to the file system tool. On Windows it would interpret the name as a file name. For example a file called a.b.iso would be treated as a file with a.b extension and the file extension ".iso" would be

People spontaneously learn by observing the actions of others, showing evidence for implicit learning. However, these observations are limited to the learned actions, and only have been shown to occur when a companion animal was modeled as a model for an agent's actions. Therefore, it is unknown whether observer learning can occur to any arbitrary observed actions, i.e., whether observer learning is universally applied. In this experiment, we show that observers learn an arbitrary sequence of button press actions with a companion who 3e33713323
