===== \*XMLStarlet\* is a collection of many command line utilities to process XML documents, with an emphasis on handling of multiple documents and documents containing XHTML fragments. The core utilities '\*XMLStarlet\*' and '\*xmllint\*' handle XML documents and XHTML, while '\*xsl:string\*' provides fast and flexible string manipulation. However, even these core utilities offer options to handle more complex scenarios. For example, '\*xmllint\*' has options to manipulate the well-formed constraint, control namespaces, and output result in plaintext rather than XML. XMLStarlet is portable to UNIX, Mac OS X, and Microsoft Windows. This package also contains a '\*devel\*' directory with development utilities, such as a '\*tags\*' files and a '\*diff\*' application. \*NOTE\* XMLStarlet cannot load stand-alone XHTML or HTML files. A HTML file must be specified as input by the '\*-o\*' or '\*--output\*' option. Installation: ===== This release is available via SCCS or CVS. It looks for changes and replays the original source content in output. There are 3 additional parameters which can be used when using the transformed mode to control the replacement of content -f: Replace all occurrences in document -f: Replace all occurrences in document except comments -f: Replace all occurrences except comment and whitespace It is recommended to use the -f option to perform replacements all over the document Document transformation XMLStarlet can be used to convert an XML document to other XML format By default the output will be in XML compatible format but with the -s option XMLStar
