Q: Cloud Functions for Firestore Function not firing when retrieving documents

For some reason, when an object in my Cloud Firestore collection is written to and retrieved, my code in my `firestore.onWrite()` function does not execute. It works when the documents are created and written to, but not when the document is loaded and found.

```
var db = firebase.firestore();
exports.userSearch = functions.firestore
  .document('user/{userId}')
  .onWrite(event => {
    const userId = event.params.userId;
    const checked = db.doc('user/' + userId).get() == null;
    console.log(checked);
    if (checked){
      db.collection('user')
        .where('userId', '==', userId)
        .get()
        .then(querySnap => {
          // ...
        });
    }
  });
```

RKT SplitMerge Crack+ Full Product Key

RKT SplitMerge helps you achieve maximum optimization on files which size increases the longer it stays on the hard drive. By splitting the file into a series of smaller segments, this application greatly reduces the size of the original file, as well as the number of file fragments needed to store it. With RKT SplitMerge you can control how many files and in which sizes you want to have. You can also decide whether you want to keep the original file or not, keep the original file if an identical copy is found, or merge the fragments into one. RKT SplitMerge is able to detect a duplicate file based on file name, file size, and file checksum. After splitting your file, RKT SplitMerge will let you know the total time it takes to split and where does that time come from. It will tell you how much you will save in space, how much you will save in time, and how fast your computer will be able to proceed afterwards. You can check out the RKT SplitMerge screen shots below to get a better idea of what it can do. Main Features: Multiple output options: choose either a single file, a folder or files by series. Merge fragments into one file: after the split process has completed, you can manually merge the fragments into one file. Include/exclude files: you can choose to include and exclude certain files in the series. Checksum verification: verify the hash of a file as well as display the MD5 and CRC32 data. Split timing: monitor the splitting process, and get the time it takes. Split, Merge and verify your files: turn the application on and off to split, merge, or verify files. Split, Merge and verify your folders: turn the application on and off to split, merge, or verify folders. Smart checksum calculation: checksum two files and combines the files checksum. User-friendly interface: window layout, edit and verify buttons are all on the left side of the application. Recoverable application: if RKT SplitMerge is stopped unexpectedly, files will be saved. Help File: detailed instructions and manual. What's New in the?

----- RKT SplitMerge is a simple, free, open-source software solution that will make it possible for you to split any file in as many fragments as you want, by size or number of resulting output files. With RKT SplitMerge you can easily split the selected item, or a set of selected items. Just select the items that will form the new file, by clicking or pressing the right or left mouse button. The selected items will be separated by any non-selected item so it will not affect the selected item(s). If you want to join the files, just select them one by one and they will be joined together. RKT SplitMerge will not, of course, affect your original file. You can review the MD5 and CRC32 hash of a file with RKT SplitMerge. -MD5: It will show the MD5 hash for the entire file. -CRC32: It will show the CRC32 hash for the entire file. -A file of any type can be hashed: text, images, audio, video, etc. By default, RKT SplitMerge will show the hash for the selected items: it will not show the hash for the remaining items, so you don't have to worry about any odd output. Both the size and number of the files will be presented for you to select. -The size is set to default. -The number of output files is selected through a 1-100 range. -You can also set a minimum and maximum number of output files. -You can set the number of fragments, by setting how many items you want to split into equal-sized fragments. The results will be presented in the following files: -List with the Path and Name of the selected items. -If your selected items are not the single item: list with the Path and Name of the first selected item. -List with the Path and Name of each resulting fragment. -List with the Path and Name of the original file. -List with the Path and Name of each resulting fragment, divided into a suitable resolution. -List with the Path and Name of the first selected item, divided into a suitable resolution. It is important to note that RKT SplitMerge will only split the files you select, but it will not split any files that are already running. So it is advisable to start the program and let it run for
