Application Programming Interface (API) The AutoCAD API is a collection of API definitions that facilitate the development of third-party tools that manipulate AutoCAD objects (geometry, drawing attributes, etc.) using programming languages such as Visual Basic, VBA, or AutoLISP. In addition, the API provides a programming environment to write applications (plug-ins) to extend AutoCAD functionality. the first weekend in December, but prices have gone up since then. I'm willing to spend less than \$10 for a ticket, but not the same as purchasing it for \$15 to \$20. That's just one of the reasons I use tickets. "But how do you program your compiler?" -You don't have to. We use Java, so we use Eclipse and all of the plug-ins that help us program. The plug-ins are not always free, but they have a huge community and they are the best tools for what they do. "But how do you convert your project from one platform to another?" -Again, we use Java. The tools that do this are free. "But how do you run it?" -You don't have to. We use the Java Development Kit. If you want to learn how to program in Java, that is the easiest thing to get started with. Finally, I work in a smaller company and the way we develop our programs is different from most large companies. It's a good question, but it's off topic. Oh, I don't mean to make it sound like my response was arrogant. I just mean, the people that use Windows or Mac for development are probably a little more experienced at programming. In my experience, the first thing that keeps people from buying a ticket to my lectures is the fear of having to learn a new IDE, or new programming language. I'm not saying they're right, just that this is something that often comes up. Again, I don't mean to come off as condescending. I think you are very smart and I respect your knowledge and ability to articulate it. It's just difficult for me to come to terms with your viewpoint because I'm not a programmer, and I don't think that I am completely ignorant of development environments. So, I don't see any value in marketing my lectures on Linux to people like me. Yeah, I see where you're coming from. I don't think you're being condescending. I just think that people like me aren't likely to be at an advantage over people who are more familiar with developing on a platform like Windows. I was a fan of Java because of the platform independence, but the JRE, JDK, and all of the documentation that comes with those things is very confusing. For example, when I look up how to compile a piece of code, there
