Dynamics and mechanisms of sonochemical activity of different materials as TiO₂ microbubbles in the presence of ultrasound in water. The efficiency of sonolysis of some metal salts in the presence of ultrasound (US) was examined using the microtiter plate method. The influence of the type of added reactant, concentration of the reactant and US intensity on the kinetics of these reactions was studied. The influence of initial pH on the sonolysis of ZnCl₂ in the presence of microbubbles (MBs) was also studied. It was found that the rate of dissolution of metal salts in the presence of microbubbles was enhanced by 5-10 times. The effect of US intensity was relatively constant and depended on the type of reactant, initial pH, and sonication mode.*s. Let n be $s/(-4)^4/(-3)$. Which is the third biggest value? (a) n (b) -0.3 (c) 0 b Let p be $(-45)/(-27) + (-4)/6$. Which is the third smallest value? (a) -5

Gaps in procedural research training in Europe: current status and future prospects. The aim of the present study was to ascertain how different groups of procedural researchers, namely the different EU member states, the Clinical Research Infrastructure Network (CRIN) Partners, and the European Medical Research Council (EMRC) best practice centres, are perceived to be training their staff in research methodology. A survey based on the most recent available data on the number of doctorates and master's degrees awarded in procedural research in European countries was developed and distributed to representative group of people involved in procedural research. In a total of 39 countries surveyed, there was a statistically significant difference in the number of doctorates and master's degrees awarded in procedural research between the countries: although numbers were highest in Belgium, the Netherlands and Sweden, the countries in the lowest quartile were Estonia, Poland and Portugal. Furthermore, the perception of these researchers was
