AutoCAD is also able to read and write.NET files. Version history The AutoCAD program has undergone several major revisions since its initial release in 1988. AutoCAD 2018 In 2012, Autodesk introduced a new Autodesk Application Programming Interface (API) to provide a simpler way for developers to access and modify AutoCAD functionality. The AutoCAD API is built on.NET and is open source. The API allows for customizing AutoCAD using a new technology called Chatter. The API also allows developers to create plug-ins or extensions that could, for example, create a custom drawing template. In 2016, AutoCAD introduced the Service-Oriented Architecture (SOA) to make it easier for software companies to create their own plug-ins or extensions for AutoCAD, as well as provide developers with better controls and access to the main application. Autodesk Exchange In late 2009, Autodesk Exchange Apps (AEA) became available to developers. It was a free download, allowing the software developer to create an application that runs on any Windows operating system, including Windows XP or Windows 7. Applications created using Exchange Apps were fully supported. The Exchange Apps program was offered for developers to build applications that would interact with existing AutoCAD functionality. AEA offers a web-based interface, which allows developers to build the application, upload the application and view the results. The Exchange Apps program also allows developers to create applications that could, for example, add a treeview to the drawing area that would allow the user to select a specific drawing and display its information in a table format. An example of this would be a custom report that displays a schedule of a building project. AutoC a1d647c40b
