References Category:Lists of softwareQ: How to mark the end of each iteration of a while loop? How can you mark the end of each iteration of a while loop? while() { do something; #) { do something; return; } Alternatively, since Perl 5.10, you can use a list context for the loop: while() { do something; last; } Q: how to run python script with command line arguments as another program with subprocess I am using python script in order to extract specific function from another program. I want to run python with command line arguments in order to extract function. I am using the following command to run the python script subprocess.Popen(['./analyse_results.py', str(data_dict["timestamps"]), data_dict["p"]], stdout=PIPE, stderr=PIPE) it does not run python correctly, and I need to use subprocess.call() method to run it as a separate program the python script looks like the following import sys import os import optparse import time import subprocess opts = optparse.OptionParser(usage='%prog [options] [timestamps] [p]') opts.add_option('-p', '--p', dest='p', action='store_true', help='print program parameters to stdout (useful for debugging)') opts.add_option('-o', '--output', dest='output_file', help='output analysis results to this file') (options, args) = opts.parse_args() if len

Category:Trouble shooting Category:Utilities for WindowsMultidimensional single-step purification of highly active Pt/rGO catalyst supported by precipitated calcium carbonate for supercritical water oxidation of ethanol. The performance of the catalyst based on rGO supported by precipitated calcium carbonate (PCC) was examined in supercritical water oxidation (SCWO) of ethanol in a batch reactor. The catalyst was prepared using a simple precipitation and heat treatment method. Then, the effect of calcination temperature on the activity of PCC-rGO catalysts was investigated. The catalyst containing 50 wt% PCC was found to exhibit the best catalytic performance. It exhibited a wide temperature range of its catalytic activity (280-315 °C). The catalytic activity of the 50% PCC-rGO catalyst increased by 48% compared with that of the unmodified PCC-rGO catalyst, showing that the addition of PCC enhanced the catalytic activity of PCC-rGO. The addition of PCC increased the total acidity of the PCC-rGO catalyst due to the acidic properties of PCC. To enhance the catalytic activity and improve the activity of the catalysts, calcination was performed under various conditions to remove the active carbon at various temperatures, and the activity was evaluated. The catalyst calcined at 400 °C, which was most suitable for removing active carbon, was found to have the highest catalytic activity among

the catalysts calcined under various conditions. The catalytic activity was also confirmed using the pseudo-first-order kinetics. The rate constant for SCWO using a 50% PCC-rGO catalyst calcined at 400 °C increased by 38% compared with that of a 10% PCC-rGO catalyst, showing that the enhancement of the catalytic activity is attributed to the increase in the total acidity of the catalyst.Bringing a Barista to Your Table There are more and more great places to drink coffee around the Twin Cities, but what really sets one coffeehouse apart from another is the barista who makes it. You can choose among a variety of stouts, latte art, and if you're not staying in, well, there's always a decent macchiato. So here's our guide to the very best barista in town, and our 10 favorites. Kathy Orlowski and Katie Fogarty are definitely committed to their craft. 54b84cb42d
