This study was conducted to evaluate the ability of white-rot fungus Trametes versicolor to degrade various dyes, with and without the presence of commercial laccase-producing white-rot fungus Phanerochaete chrysosporium, at 30°C. Effects of dye dosing and initial fungal inoculum on dye biodegradation by T. versicolor and T. versicolor co-culture with P. chrysosporium were studied. Steroid hormones, phytohormones, and organic acids were also examined in the culture extracts of T. versicolor and the co-culture to explore possible fungal degradation pathways. T. versicolor could efficiently degrade all dyes tested. Addition of P. chrysosporium increased the degradation rate of textile dyes and slightly enhanced the degradation of plastic dyes. However, the presence of P. chrysosporium did not increase the activities of lignin peroxidase (EC 1.11.1.14) and manganese peroxidase (EC 1.11.1.13), which was the important enzyme involved in lignin degradation, in the culture extracts of T. versicolor. The enhancement of dye decolorization in the presence of P. chrysosporium was related to the increase of dissolved oxygen availability. The presence of P. chrysospor 09e8f5149f
