Importing images in GIMP One of the best ways to get started using a program is to import an image into it. Any image-editing program that supports layers and image editing should be able to import images. You can use the 'save' command to save images to your hard drive. You can also work with them by opening a file in a program or viewing them from a folder or directory. It's all up to you. For example, you can open an image file in any of the programs in this book by using the file type's icon: '.psd' for Photoshop, '.jpeg' for iPhoto, and so on. Importing images is as simple as choosing a file and clicking *Open*. You may not think of it as importing a file, but it is.

Brushes differ from pens. Pens are held by the hand and draw on the canvas, creating a stroke. You can control the opacity, hardness or curve of the stroke. Pen tools are quite different than brushes. They give control over the size, shape and positioning of the stroke. Brushes, however, can be used for pen-like effects as well. Brushes are Photoshop's most sophisticated tools. Once you learn how to use them, you can go wild with making various effects and mastering painting. You can create brushes in any color or layer. To do this, click the Brush icon (shown here) and then choose Create a Brush. A pop-up menu appears that lets you name the brush and select the color you want to use. Keep in mind that colors are not limited to red, green or blue. In fact, you can combine colors to create a wide variety of colors. Brushes are best suited for one-shot effects. If you want to apply a new effect to an existing image, use the Brush tool. Make sure that the Object option is selected (below the tool) to select the area of the image where you want to paint. You can also use the eraser to remove the paint from a brushstroke. If you are working on a solid color, you may want to switch the Hardness to Normal. Then you can control the subtle smoothness of the brushstrokes. Go to the menu and choose Size and then Control to select this option. Brush Tip To help you choose a brush tip, click the Help button at the bottom-right corner of the Brush window. The BrushTip menu appears. It lists the classic brush tips, such as Hard round, Soft round, Hard flat and Soft flat. Click the Help option to see other tips, such as preset brush tips. Brush Tip Double-click the Pen icon to open the Pen dialog box. Below the thick brush tip and brush size are two additional options, Maximum pressure and Interpolation mode. These options control the pressure you apply on the brush as you draw. These are the settings that you will most likely use when working with pens. Select Continuous or Linear Interpolation. The next tool down is the Thickness/Hairiness. Start with 0 and then click the Increase option to raise the value. You should be able to see an effect in your image. To lower the value, click

Q: Is it possible to attach api.cov to a directory or file and not to the projects built, but only the ones imported to a project? I have a few projects, that I want to perform some coverage for. I was thinking if I put the api.cov to the directory where the projects are stored (and not to the projects themselves) it would be possible for me to run tests directly on the project, instead of using the api.cov. This way I would have the same coverage results as if I had run the coverage command within the project. Is it possible or do I have to add the api.cov to the projects? A: I would not recommend putting the file in the source code, but if it's required, yes, it is possible. You'll need to have two copies of your code in some location on your machine: one for the normal build process and one for the cov. The reason why it's not recommended to add the file to the sources, is that the source code is the place where you link to, so you want to avoid changing it or moving it around. This might be why you were hoping to avoid the source code. Regardless, it is possible and relatively straightforward to create a regular build without running cov. It can be done with cmake for example. Here are some tips: It's recommended to use a separate directory for sources. Make sure that when you compile your sources, you're passing `-DQT_NO_EXCEPTIONS` to your compiler, so that it does not force you to "turn on" exceptions in the code - this is especially important when you're doing error handling. If you're looking for more details, you can either look at the qnake documentation or CMake documentation.

Q: Can two non-adjacent vertices of the same graph have the same distance to a third vertex? Let G be a graph. Let S, w be two vertices, not necessarily distinct. If we denote by $d(v,w)$ the length of a shortest path from S to w , can we say that $d(v,w) = d(w,v)$? I'm looking for a "yes" or "no" answer, with the "yes" answer as a reference. A
