Facet steering is an important feature that can enhance the spectral efficiency of millimeter wave (mmW) networks. A beam-forming based multi-faceted (Beam-FAC) antenna array is proposed to improve the overall system throughput in millimeter wave networks. This work presents a control scheme to dynamically steer the gain of array elements to realize multi-beam steering in a dynamic and real-time environment. The proposed system controls a multi-faceted array with fewer degrees of freedom by comparing the array's output with the reference signal in the training process. The tuning process of the feedback controller is based on the gradient descent method and the covariance matrix approach. In the feedback control process, the matrix inverse function must be used to transform the observation vector back to the training vector. The computation cost of matrix inverse function is expensive, and we propose a parallel approach to reduce its computational cost. After the proposed control scheme is applied in a beam-forming based multi-faceted antenna array, the low-dimensional tracking error matrix is iteratively tuned by the proposed feedback method to approach the desired tracking pattern. Simulations show that the proposed control scheme can realize the dynamic and real-time control of multi-faceted antenna arrays. Sudden death due to road traffic accident: an autopsy study. Postmortem examinations were performed on 825 consecutive cases (372 men, 453 women) of sudden death in Southern Finland, of
