Choose a color space from the file's browser (see the sidebar "Saving an image in Photoshop"), or open a new file in the desired color space. Then, using the Layer dialog box (choose Layer⇒New Layer), create a new layer above the existing layer and rename it whatever you want. You can then edit the new layer to do whatever you like with the photo. You can selectively draw on the layer, apply color correction and color balance tools, flatten all or some of the image's layers, and even create a new type of layer that allows you to blend image information from one image layer to another. Creating and editing layers is discussed in Chapter 6, "Photography with Adobe Lightroom." The Open Heart Versus the Closed Fist. Open heart surgery is steadily evolving and becoming a more common practice. This article compares the benefits and risks of the open and closed heart surgery using an illustrative case. Open heart surgery is performed when a large opening is made in the chest to improve visualization, and usually is done for congenital heart disease. Today, elective heart surgery is performed safely in low- to middle-income countries. Improvements include technological development, training of health care providers, and a better understanding of medical imaging. Open heart surgery has a higher morbidity compared with the recent advancement in technology and is not worth for elective non-cardiac surgeries. As this technology improves, we may have the possibility of doing heart surgery in patients with significant comorbidities.BST promoter polymorphisms are associated with the clinical presentation of allergic rhinitis. BST2 (butyrophilin subfamily 2, also known as CD277, BTN3A1, and TACTILE) is an IgSF (immunoglobulin superfamily) membrane protein with a novel secreted pro-inflammatory function. Significant relationships have been shown between the level of expression of BST2 in epithelial cells and allergic diseases. The aim of this study was to investigate the role of BST2 promoter polymorphisms in allergic rhinitis (AR). Three BST2 polymorphisms, -23G>A (rs10241996), -638G>A (rs12819450), and -130T>C (rs10866440), were genotyped in 377 AR patients and 905 healthy controls. The -23G>A polymorphism was associated with total AR [p =.002; OR (95% CI) = 1.48 (1.16-1.89)], AR with nasal symptoms [p =.002; OR (95% CI) = 1.47 (1.15-1.90)], and AR with pollinosis [p =.001; OR (95% CI) = 1.33 (1.11-1.60)]. The -638G>A polymorphism was associated with AR with nasal symptoms [p =.014; OR (95% CI) = 1.47 (1.07-2.02)], AR with pollinosis [p =.014; OR (95% CI) = 1.33 (1.07-1.63)], and AR with combined nasal symptoms
