Adjusting Color The first step in preparing images for print is to adjust color. It doesn't really matter if you are creating prints of a photograph on a desktop printer or an order for multiple prints on a high-volume printer; the images need to be on the same level of color and contrast. In this section, I show you how to adjust the color of an image using the built-in controls or with an image-editing application. Each photograph has color tones and shades, in addition to the light and shadow that comprise the image. To achieve a more uniform color and image appearance, you need to adjust all these components. Adobe Photoshop is set up in a way that enables you to correct and even subtly alter color on your images, and it does this using `_levels_`, a feature that enables you to have precise control over the tonal range of your image. Levels can allow you to darken and lighten areas of a photo simply by dragging a color selector around the image. To use Photoshop's levels feature, choose Adjustments from the Photoshop toolbox and click Levels. You see a number of tools displayed in the Levels dialog box, as shown in Figure 3-14.

**Drummond Castle** Drummond Castle is a ruined castle near the village of Drummond in Perth and Kinross, Scotland. The castle site is situated on a high point, overlooking the River Tay. **History** The castle was built in the mid-fifteenth century by Thomas Bruce, 11th Earl of Elgin, as his principal Scottish fortress. The site was originally occupied by a broch, built by John de Graham. The tower and parts of the curtain wall remain and the site is a scheduled ancient monument. At the beginning of the seventeenth century the castle was the seat of the Earls of Perth. The extensive ruins of Drummond Castle are now protected as a Scheduled Ancient Monument. **Building** The existing castle ruins are built around a strong, square, central tower about in height. There are three main areas of investigation at the castle site: the western range, containing the inner ward, the outer ward and the western tower; the eastern range, containing the entrance gatehouse and a narrow passage, which is the only known access to the lower castle; the north-east range, where the foundations of the chapel are located. **The western range** The western range of the castle remains roughly square in plan, about per side, and is accessible through a large, multi-arched, gatehouse with walls that are around thick. The lower part of the inner ward is only about lower than the upper part, which is the original structure of the castle. The building materials of the western range are red stone, with bands of ashlar on the quoins and ashlar on the window surrounds. The windows have been boarded up and the stone is weathering. The massive western tower is currently in a poor condition, although portions of the tower have survived. **The eastern range** The only entrance to the castle is through the eastern range. This was an earlier range built on a lower level than the western range, but it has been modified over the centuries. The foundations of the chapel and the gatehouse are visible, as well as the rounded arches and square windows of the former gatehouse. Southwest of the castle are the ruins of the machicolation, a type of fortification used in medieval Europe for controlling troop movements. The lower floors are about above the floor of the southern inner ward, and the remnants of the machicolation have been incorporated into the machicolation stairs which are

### What's New in the?

Enhanced translocation of alanine in the rat brain after intraventricular injection of alanine hydroxamate. Using the technique of intracerebral dialysis with hypothalamic-bound styrene maleic anhydride, the present study demonstrated for the first time the existence of a l-alanine-specific transport system in the hypothalamus of the rat. Intravenous injection of alanine hydroxamate to these rats enhanced the accumulation of l-alanine. The same enhancement was observed by intraventricular injection of the inhibitor when the accumulation of l-alanine was measured in the hypothalamus in vivo. A bolus injection of l-alanine hydroxamate to rats given intraventricular injections resulted in a decrease of l-alanine concentration in the cerebrospinal fluid and an increase of l-alanine concentration in the perfused hypothalamus dialysates. These results suggest that the intraneuronal transport of l-alanine is enhanced by the intraventricular injection of l-alanine hydroxamate.

**In vitro antiproliferative activity of EMITOTEC(R) (BIOMURA) in advanced breast cancer.** Twenty-six patients with advanced metastatic breast cancer and no prior chemotherapy received BIOMURA (EMITOTEC, BIOMURA Ltd, Westbury, NY) at a daily dose of 1.5 mg/m<sup>2</sup> as a continuous intravenous infusion over 5 days. In 11 of the 24 evaluable patients, tumor regressions lasting from 2+ to 4+ months were observed. The maximum tolerated dose of BIOMURA was 1.5 mg/m<sup>2</sup> with dose-limiting toxicities consisting of painful bone infarctions and airway obstruction. BIOMURA showed antiproliferative activity against breast tumor cells in vitro. Eighty percent of the patients in the 1.5 mg/m<sup>2</sup> cohort had evidence of tumor regression (i.e., > or = 50% reduction in the product of the longest diameter and its perpendicular at the tumor border) with one of the best responses (2-month regression) seen in a patient with marrow metastases.
