Oil and gas wells that are located far from access roads and not easily accessed by conventional means such as pumping systems often comprise drop in energy levels using for example pumping systems, for reducing or raising the pressure of the well fluids as compared to ground level. Natural gas may be emitted from these wells and any other existing or potential hazards should be considered to prevent the emission of gas into the environment. Conventional gas sensor technologies are often difficult to install and are exposed to harsh environmental conditions resulting in loss of functionality or fail-open failure conditions. Numerous different types of gas sensors have been developed over the years. Most of the known sensing technologies are based on the reaction of a sensing layer to the presence of specific gases and/or vapors in the surrounding atmosphere. An example of such sensing layer is a catalyst. Different catalysts respond to particular gases and/or vapors in a different manner. For example, a catalyst may react with either NO or NO₂ to form NH₃ gas. Since the reaction producing NH₃ gas occurs in very different manner for NO and NO₂ gas, the former reacts with the catalyst to form NH₃ gas and the amount of NH₃ gas is directly proportional to the amount of NO₂ gas. Other catalysts may react with O₂ gas to form CO₂ gas, which can be detected using a CO₂ detector. Yet other catalyst reaction may be used to detect other gases and/or vapors. More examples of such catalyst reaction are shown in table of additional known gases and/or vapors that can be detected by gas sensors based on a catalyst reaction. Known gas sensors, although usable, have various drawbacks in terms of reliability and functionality and/or their performance and are often more expensive than desired or desirable. One type of gas sensor includes a first electrode, a sensing layer and a second electrode. A first current, which is substantially proportional to the number of gaseous molecules at the first electrode is provided across the electrodes. A second current, which is substantially proportional to the number of gaseous molecules at the second electrode is provided across the electrodes. The difference between the first current and the second current is used to determine the concentration of gas at the first electrode. Such gas sensor is described in WO 2006/128113 and is commonly known as a difference current gas sensor. The difference current gas sensor suffers from some drawbacks in that the difference current is limited by the first current and accordingly there may be a need for a high first current that may

The 101 and the Black Box Exploding with eight time-worn ideas for the future, The 101 and the Black Box may be the most exciting event of summer 2017! Imagine firecrackers going off every time you hit a red light, a green light and a yellow light. Imagine a highway system without cars. Imagine a world where trains are all the rage, and where cops, firefighters and everyone else are on motorcycles. Sounds crazy? It might just be the future. To tell the tales of a future past, the folks at Oyama Media have enlisted a group of professional artists, writers and musicians to throw their hats into the ring. They'll be awarding a \$2,500 college scholarship for a young, aspiring musician who'll create their own original video for an Oyama 101 and the Black Box performance. Moderated by local and national radio personality and music lover Tim Patton, Oyama's Bellwether Festival will be held at 180 E. 1st Ave. Downtown in the spring of 2017. "This idea has been in the works for almost a year," says Oyama's Al Hansen. "We've had a lot of great artists submit ideas, and we've invited a lot of people on board. I think Bellwether Festival 2017 will be a great showcase of the future." The 2018 Oyama Festival will be held Nov. 30, according to organizers, because of the holiday season. Oyama will unveil the final lineup of performers, but one can probably expect the likes of the Knife Party and Kraftwerk to perform. It's not hard to imagine the future it's hinting at. When most people look around them, they see traffic, pollution, crowded sidewalks and mountains of garbage. "There's so many things that are going to change the world," says Oyama's Madisen Gallo. "I feel like we're in a really unique time. The world's been influenced by the internet, and the world of commerce is being transformed. There's a kind of renaissance happening right now." The idea of the future is oftentimes scary, but Oyama wants to tell stories of the possible. "Here's where we could go," says Hansen. "Here◆"
