2. **Paint.** This is an excellent illustration program that helps you to draw images from scratch or to create an outline of an image that you can fill in by painting. Paint is very easy to use and is often used by beginning artists to get a feel for how to create an illustration. 3. **Illustrator.** Illustrator is another digital illustration program. It is often used to create icons, logos, and other design elements. It is very simple to use, and you can customize the way images appear by changing the way text, shapes, and icons are laid out. Illustrator uses vector objects that can be scaled up to cover large areas. 4. **InDesign.** InDesign is a layout program that enables you to create and edit a design of type and images or text objects. It uses tags and other hidden areas to keep an object within a particular area of the page. This enables you to change the size, spacing, and location of an object without changing other objects or images in the page. 5. **PolarPro.** PolarPro is a screen-to-plate photo printing program. It works with the Photoshop file extension _PSD_ and therefore you can combine Photoshop and PolarPro into a powerful photo printing and editing package. With PolarPro, you can manipulate your images to create cropping, resizing, correcting color, printing, and creating a file that can be used for screen-to-plate printing. 6. **HueLab.** HueLab allows you to create and edit color by selecting a color and changing it to any other color you choose. It has a color wheel for the user to view, work with, and select from. ## Creating a Vector Image The term _vector_ refers to the shape of the item you're creating, regardless of size. For example, you can create a square shape, a circle shape, or even a shape based on a curve that you draw. Vector images are created by having software define the shape and then placing it on a grid and filling it in. This process is very similar to how you would produce a drawing by hand. You can use lines to create shapes, and you can vary lines to form a three-dimensional object.

Q: How to capture a shortcut key with code and logging it in an event handler in C#? Is it possible to do that with the C# windows 7 api? I tried to log the key in a event handler, but there is no event thrown when I press the shortcut key I am interested in (e.g. Ctrl+Shift+K) A: The problem is not the event: Alt+F4 invokes KeyUp without any additional notification. The problem is, that you need to handle another hot-key yourself (e.g. "Alt") with the KeyDown event and then fire the KeyUp event if the same combination is pressed again. This is not a problem, because you have full control on the sequence of action in your application. MIAMI (Reuters) - The family of a 15-year-old girl wounded in a shooting on Miami's South Beach last year has filed a lawsuit alleging negligence against officers who opened fire on her. Julio Cesar Rubio, the 15-year-old boy accused of shooting her, is escorted into a Miami-Dade circuit court in a wheelchair in Miami, Florida, U.S., September 28, 2017. REUTERS/Joe Skipper The lawsuit filed in Miami-Dade circuit court in Florida was brought by the parents of Julissa Menendez on behalf of the girl, who is not identified in the suit. The family alleges that the girl was shot more than a dozen times and that the officers responding to the scene fired 21 rounds into her, including four rounds "fired in a pattern to deprive her of her life." The men were assisting several officers who were canvassing an area of Miami's South Beach on January 28 when they "heard a lot of yelling and screaming coming from a building," the lawsuit alleges. They found the girl lying in the street. Coughing blood, she told them she had been shot, according to the lawsuit. According to police, she had been shot by Julio Cesar Rubio, whom she was allegedly dating. He was later arrested and charged with murder. Her mother, Claudia Menendez, told reporters last week that the girl survived but her brain was damaged. The officers responding to the scene were identified as Edward Lozano, Miguel Del Pilar, Armani Gonzalez and Henry Cruz.

Projects (aka operators) can select which project to deploy from a secure namespace that includes Docker images, network, secrets, configuration, and pod set-up. The credential store is an ephemeral credential store for storing authentication information. Containers are containerized projects that represent deployments of the project. Containers exist in Pods. Each Pod has its own storage hierarchy in which pods reside. A Pod can hold a maximum of three containers. Each container can have its own namespace (configuration via PodMan). A container can be a Kubernetes Deployment or a KEP. The process of removing a container from a Pod is a k8s workload. /***/ /* */ /* ftbdf.h */ /*
