For each line, after line2, you need to skip the first 2 characters (in this case ` and the last `), use the -2 flag, store everything into file1 and store file2 into \$i grep -F -v -2 "\$line2" file1 > file1_n2 grep -F -v "\$i" file2 > file2_n2 uniq -c file1_n2 | sort -nr | uniq -c | sort -nr uniq -c file2_n2 | sort -nr | uniq -c | sort -nr Output 1 1 file1_n2 12 6 file2_n1 Now you can append them, assuming there is 3 lines like this, this would extract the 4th field uniq -c file1_n2 | sort -nr | uniq -c | sort -nr | awk '{print \$4}' A different example Consider the following input 1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 35 36 37 38 39 40 41 42 43 44 45 46 47 48 49 50 51 52 53 54 55 56 57 58 59 60 61 62 63 64 65 66 67 68 69 70 71 72 73 74 75 76 77 78 79 80 81 82 83 84 85 86 87 88 89 90 91 92 93 94 95 96 97 98 99 100 101 102 103 104 105 106 107 108 109 110 111 112 113 114 115 116 117 118 119 120 121 122 123 124 125 126 127 128 129 130 131 132 133 134 135 136 137 138 139 140 141 142 143 144 145 146 147 148 149 150 151 152 153 154 155 156 157 158 159 160 161 162 163 164 165 166 167 168 169 170 171 172 173 174 175 176 177 178 179 180 181 182 183 184 185 186 187 188 189 190 191 192 193 194 195 196 197 198 199 200 201 202 203 204 205 206 207 208 209 210 211 212 213 214 215 216 217 218 219 220 221 222 223 224 225 226 227 228 229 230 231 232 233 234 235 236 237 238 239 240 241 242 243 244 245 246 247 248 249 250 251 252 253 254 255 1cdb36666d

Hellmut Ernst Aparatos De Elevacion Y Transporte D amore festplatten liQ: Can we do an aggregation in a django view There is a model named Measure where I have the following fields field1 field2 field3 Now i want to aggregate these fields in a django view so that the view looks something like this { "field1" : 1, "field2" : 1, "field3" : 1 } I want to make the field1 aggregation and the field2 as a count of all the records in the table. The same should be applied for field3 A: You need to define a template for your view and in that template, use the aggregation function. Something like this: def calculate_something(request): # Do something return render_to_response('view.html', context={'calculated_value': calculate_something_for_measure_instance}) In your template.py file, define your view as calculate_something_for_measure_instance = Measure.objects.all().aggregate({'field1':'sum', 'field2': 'count'}) Q: Trying to figure out what "Distribution" is in rank correlation. Does it only affect p-values or does it also affect confidence intervals? When performing a rank correlation test, the "Distribution" property of the test is indicated
