This article is more than 9 years old. Documents leaked by hacker collective Anonymous suggest that the Saudi Arabian government is behind the hacking of the country's top political website. The files appear to show that the hacking operation was timed to coincide with the kingdom's King Abdullah's meeting last week with Barack Obama. "The mission of this campaign is to repress the corrupt and stifle the voices of dissent through exposing the nefarious activities of the Syrian Electronic Army," says one file, referring to an internet vigilante group with ties to the Syrian government. A file titled "Operation SSL Stripper" appears to confirm the nature of the attack: "We did start to wipe out their webserver today, they are down." Although the file provides no information on the root cause of the attack, some of the documents apparently refer to a Saudi government "strategy to attack secrets" about Saudi Arabia's situation in the world. "The Saudis are thought to be among the targets of this week's attack, according to the media monitoring group Global Risk Insights. Fears that the Syrian Electronic Army hackers may be linked to the Saudi authorities have been growing as news of escalating military action in the country has overshadowed the searing reports of civilian deaths and destruction. The initial stories of the attack were reported by the New York Times. The Syrian Electronic Army, which is linked to the Iranian government, has been credited with hacking into the US news website of the Associated Press. That hack took place in late April, shortly after the BBC and other media were blocked in Syria. The group also appears to be behind an attack on the Al Arabiya news website earlier this year. Actions by such groups are widely seen as a reaction to actions taken by the regime of Bashar al-Assad against the anti-government protesters. The Guardian reported on Monday that the Associated Press had reversed a decision to drop the Syrian Electronic Army as a source after it admitted it had fabricated news stories.

## Vive Keygen

As we mentioned earlier, the HTC Vive is a virtual reality headset and motion controllers bundle for PC. Stick around to learn more about the functionality of the HTC Vive Hardware, HTC Vive software and the best things to do with it. The HTC Vive is a very immersive & realistic experience through the HTC Vive software that comes with it. The first thing that catches your eye is the HTC Vive headset, which sits comfortably on your head and is equipped with a laser tracking system that ensures zero latency and helps you to move around in the virtual world with total precision. The HTC Vive controllers are designed to provide you with maximum comfort, range of motion and tactile feedback. They both have physical sensors on the front that connect to the motion tracking sensors inside the HTC Vive headset. I think it's time to see what's new in the Valve franchise. It's been a couple of years since the last Half-Life game, and there are no real signs that Valve is working on a new installment. But we do know that they are working on some other games (Source 2), so it would only be a matter of time before some of that goes free. We now have the game's Steam page to show what has been going on. The entire point of Steam is the game library, and while it hasn't yet reached the numbers seen on the Xbox Live and PlayStation Network. Steam has a library of around 1.6 million games at the time of writing. The most popular game right now is Grand Theft Auto V, with a whopping 77,000 player accounts. You can also play many Steam games on your PS3, Xbox 360 or mobile devices. If you want to enjoy the Steam gaming service, you can buy a Steam computer or a Valve Controller for your TV, which will be connected to your Steam account. If you don't fancy the idea of spending money, Valve recently released a new tool called the Steam Controller, which is a small, wireless remote controller that you can use on your PC. The Steam Controller is a dual touchpad and mouse. The top section features two touchpads, while the bottom is equipped with two mechanical buttons and two traditional mouse buttons. If you're using Windows, there is also an included driver. Every Steam Controller comes with an Xbox One wireless adapter, and is compatible with Windows and OS X only. The Steam Controller's input works with all your Steam games, so you don't need to worry about mouse drivers on any other operating systems.

## What's New In Vive?

The HTC Vive is the second-generation virtual reality headset for home and portable use. This HMD can be used on its own or in conjunction with a desktop PC or mobile device, utilizing either Windows- or Android-based systems. The HTC Vive can be used for enterprise applications as well, in conjunction with VR software, corporate data, and headsets. This device comes with two tethered base stations, two controllers and the HTC Vive Software Development Kit (SDK) to help developers create content. The tethered base stations can be bought separately. Differences from the first generation HTC Vive The HTC Vive headset has been improved in two major ways. Firstly, the device now features two 1080p displays (each at 1440x1600 resolution). This upgrade allows for an increase in resolution, theoretically providing a wider view and better virtual reality experiences. Secondly, there is also a second, even higher resolution display on the inside. This optical display allows for super-high-resolution gaming and can be used even when the headphones aren't connected. The second screen is controlled by an internally-mounted optical sensor. This is certainly a noticeable upgrade and should make the Vive last longer. The Fresnel lenses, like those in the original HTC Vive headset, have also been replaced with the Fresnel lenses for the new HTC Vive so that you can see through the displays, just like you can see through your window. In addition, the specifications for each of the two display panels have also been improved. The panel supporting the headset display has been upgraded to display 90 Hz refresh rates, while the panel which contains the second 1080p display has been improved so that its refresh rate can go as high as 120 Hz. This, in turn, also allows for improvements in graphics rendering, and should help the user experience some added-on comfort. The Oculus Rift Comparison The Oculus Rift is a first-generation consumer-oriented virtual reality headset, developed by Oculus VR and released in March 2016. This headset is used with a compatible computer system or PC, and uses optical tracking to provide positional tracking within the virtual space. Unlike the HTC Vive, this system requires you to plug in the headset with any one of its two included lenses to the computer. It also doesn't include any controllers or sensors, although it does include a set of headphones. Differences from the first generation Oculus Rift The Oculus Rift is not a dedicated VR headset. Instead, it is a general purpose development kit (DK2) intended for gamers, software developers,
