Please note that the poi radar france sygic.pdf that is visible to those with internet permissions may be different from the one that is visible to those without internet permissions. The version of the file that those with internet permissions see and the version of the file that those without internet permissions see may be identical, or they may be different. But those with internet permissions can download and start working with files with a higher version number than those without internet permissions. If the version number in the file and the version number in the environment is the same, then the difference is only semantic. The version number in the file can be for any version of the file and does not necessarily correspond to any version of the file. To illustrate the point: The version in the environment might be file.tar.gz that you downloaded and unpacked and have on your disk. The version in the file might be file.tar.gz that file.tar.gz as you downloaded. The version in the environment might be file.tar.gz that you downloaded and unpacked and have on your disk. The version in the file might be tar.gz that you downloaded and unpacked and have on your disk. The version in the environment might be file.tar.gz that you downloaded and unpacked and have on your disk. The version in the file might be tar.gz that you downloaded and unpacked and have on your disk. As you can see, the version numbers in the environment and file are different, but the contents of the environment is identical to the contents of the file. Therefore, if the environment shows the file as version 2 (or higher) then you can download that file from the environment without having to unpacked it, that is you can skip the unpacking step. 2. How to know the difference between the file and the environment? If you compare the hash values of the file and the environment, you will see if the file and the environment are the same. You do this by comparing the hashes of the whole file, the unpacked version and the unpacked version in the environment, and the one in the directory that is on your disk. In the environment, you will find the file and its version number. On the disk, you will find the unpacked version and its version number. You compare these. If they are the same, they are the same version of the file. If you find the same file in both, then that is the
