
URL-Checker Crack Free Registration Code [Mac/Win]

URL-Checker Crack + With License Key For PC

URL-Checker Product Key is a small JAVA-Application which periodically connects to a specified URL and writes the results to a logfile. A great tool for webmasters to monitor the availability of their website. Just type in at how many milliseconds apart each check should occur, hit start and forget about it. If your website is down for some reason, the logfile will give you a first hint that something went wrong with your website. URL-Checker For Windows 10 Crack is not for the faint-hearted. Features: ? URL-Checker writes the result of your website to the logfile on web server which allows you to find out what's going on with your website. It reads several parameters of your URL. If the parameter is "*" it means that URL-Checker checks the current website. ? You can check how often your website is checked. You can specify a minimum of and a maximum duration of the check. If your site is down for more then the specified minimum amount of time, an alert is sent to your e-mail address. ? URL-Checker checks the error code of the HTTP-Response in the body of the HTTP-Request. ? URL-Checker checks different protocols, like HTTP, HTTPS, FTP, and Gopher. The protocol is searched in the URL itself. ? URL-Checker can read the content of a response (e.g. text-files, jpg-files, html-files, gif-files) ? If your website uses frames, URL-Checker identifies the contents of the URL of the frames on the website. ? URL-Checker can be started through the web browser (simply by entering the URL of your site) ? URL-Checker sends an e-mail if your website is not available for too long. ? If a problem occurred, the last checked time of your website is sent to your mail address ? If your website is offline for more than one minute, you will be automatically informed that your site is offline ? You can specify how often you want to check your website. Default: every 5 minutes Working instructions: ? Start URL-Checker with the parameter -i (interactive) to start with the automatic check. ? Start with the parameter -u to specify the URL of your site. Use

URL-Checker Crack + Free

Cracked URL-Checker With Keygen allows you to monitor a website's availability. URL-Checker 2022 Crack periodically connects to a specified URL and writes the results to a logfile. If the site you've specified can be accessed or not you will see a notification in the logfile and in the Messages window. Depending on the page you've queried, you may need to renew it's virtual address every 1-5 minutes or so. You can specify the URL to check by entering it in the dialog box provided on the Main Window. To keep your website up to date run the program at regular intervals (like every 1-5 minutes). When URL-Checker needs to renew a URL, it's content is stored in the cache folder (for private use only). Some details about the cache file structure can be found in the manual. URL-Checker comes with some bundled Site-Monitoring-Data. The data covers a wide range of checkups including: 1) Automatically generated Server-Fault Messages like "Site is down" or "Site is up" 2) Timer which checks the status of the Pages every 25, 50, 100 and 150seconds 3) Site availability checks from different worldwide locations (New-York, London, Paris and Cairo) 4) Site availability checks from a list of 300 different sites 5) Reports about the Page-URLs which have been checked since the last startup 6) Logging of possible errors. Have fun using URL-Checker! And do not forget to give a review in the Store where you bought it from (here). Visit our website for more info: ? ? ? ? ? URL-Checker Crack+ Keygen Full Version [2022-Latest]

This application is intended to be used as an online monitoring tool for websites. The application allows a webmaster to check the status of his website by a clicking of a button. The application connects to a URL (eg. www.domainname.com) and checks it periodically. The results are printed to the JTextPane (with a webbrowser like behaviour) or to a File. If all checks are successful, the following three text-icons are shown: ? - the website is available? - the website is not available? - the status of the website last time was successful or not. Want to know more? Have you tried our App (the not-official App)? You can download our App from the market. Important information: If you want to modify the code you have to create new Android Studio Project for the modification to work properly. I published this mod to GitHub. URL-Checker is a small JAVA-Application which periodically connects to a specified URL and writes the results to a logfile. A great tool for webmasters to monitor the availability of their website Just type in at how many miliseconds appart each check should occur, hit start and forget about it. Requirements: ? Java Runtime Environment URL-Checker Description: This application is intended to be used as an online monitoring tool for websites. The application allows a webmaster to check the status of his website by a clicking of a button. The application connects to a URL (eg. www.domainname.com) and checks it periodically. The results are printed to the JTextPane (with a webbrowser like behaviour) or to a File. If all checks are successful, the following three text-icons are shown: ? - the website is available? - the website is not available? - the status of the website last time was successful or not. In the video we will see how to build a tree structure in Java

What's New In?

URL-Checker scans a URL to see if it's still up and running. If the website no longer exists, an error log entry will be written. If the webpage is available, the URL will be listed in the report. The application can also be used to test websites after they are down. Of course, the URL is also tested if the website is up. The URL can be compared with the ones that are listed in the report. A list of all websites tested can be sorted by "Directory", "Created on", "Server", "Status", or any other sorting option. URL-Checker is very simple and doesn't use any resources to run. It can check an unlimited number of URLs. How to use it: URL-Checker can be used in the following way: 1. Install URL-Checker on your server. 2. Make an.htaccess file, which will contain the following lines: RewriteEngine on RewriteCond %{REMOTE_ADDR}!^192\.168\.225\.100\$ RewriteRule ^test(.\$) [P,QSA] 3. Make a.htpasswd file, which contains user password, or 4. Start URL-Checker. Output: Default output is like this: 'Server' 'Status' 'URL' 's' 'OK' 'sftp://ftp.dei.unipd.it/px-system/index.php' 'OK' 'ftp://ftp.dei.unipd.it/px-system/index.php' 'Error' 'file://px-system/index.php' 'Error' '~/px-system/index.php' 'OK' 'sftp://127.0.0.1/px-system/index.php'
