Photoshop will automatically open the files you have selected. You can also choose from additional filters and adjustments tools to make the image look the way you want. These adjustments can be applied to just part of the image, an entire area, or across the entire image. This allows for precise editing, and many effects can be created using just a few controls. You can also load a wide variety of plug-ins and actions, which are smaller pieces of software that add features and functions to Photoshop. Q: In emacs what is the difference between 'M-RET' and 'C-S-RET'? I have M-RET in my.emacs file. Is there a difference between M-RET and C-S-RET (i.e. C-u M-RET vs C-u C-S-RET)? A: The C-S-RET is bound to the word compute-symbol-regexp command. The M-RET is bound to the command match-face. A: The M-RET key is bound to the command match-face, i.e. edit face. It is the M for MATCH and RET for REPLACE. The C-S-RET is bound to the command compute-symbol-regexp. It is the C for CLOSURE and the S for STANDARDIZE. But to match what you are saying, it is not a REGEXp. The first character is a prefix function which is the same as the normal RETURN key with a single prefix key. This would be bound to the same command as M-RET, if it were not for the single prefix key change. Exposure and Contrast Like many computer software programs, Photoshop has features that allow you to adjust and refine the overall brightness and dark tones in an image. These features include the following: * An Exposure slider * A Levels Adjustment panel * A Histogram display The Exposure slider gives you an easy way to adjust the amount of light in an image. The left side of the slider represents a dark image, and the right side represents a light image. You can slide the slider to adjust the brightness of your image. If you are photographing a person's face in the sunlight, for example, you can increase the Exposure level and the person appears very bright. The opposite is true if you are photographing a person's face in the shade, where the exposure is too dark. A Levels Adjustment panel gives you one of the most important tools in Photoshop — the tool to fine-tune the darkest and brightest parts of your image. You can use this to even out a person's skin tone or the color of a uniform. You can also view the histogram at the bottom of the Adjustments panel to determine how evenly the image is exposed. The histogram is a vertical graph of an image's light and dark
