Field of the Invention The present invention relates to a light-emitting device, and in particular, to a surface-emission-type light-emitting device with high light extraction efficiency. 2. Description of the Related Art In recent years, a light-emitting-device technology has been developed that uses a semiconductor chip in which a light-emitting element, such as a light-emitting diode (LED), is formed. Compared to an incandescent lamp, the amount of light that can be generated from a LED is small, but there are many advantages in that the light

INTRODUCTION: The first definition of a spark is a momentary discharge of electricity from a circuit. The majority of. Stabilizers are used with sparkplugs, either as an internally positioned or externally attached part. The term sparking is commonly used when referring to the cause of explosions in internal combustion engines (combustion engines). The term is rarely used with regard to spark plugs, for example, in a third-world country, which produces a small, "spark plug" style engine. Spark plugs used in spark ignition engines, a category which includes most automobiles and motorcycles, are not commonly known by this name, "spark plug" being more commonly used to refer to ignition plugs. Spark plugs are used in automobiles to ignite fuel and oxygen inside the combustion chamber of the engine. The spark is created by the spark plug when a small electric current is passed through a gap between two electrodes that are embedded in the insulator. As current is supplied, a spark forms and ignites the mixture of air and fuel. Spark plugs are installed inside an engine and are the primary fuel-starting device (Ignition System). Because fuel is ignited by electric current, certain types of cars may lack a spark plug. Spark plugs are often used in conjunction with other ignition devices such as coil, distributor and/or electronic ignition. After the gases have been ignited, the gases continue to burn until the fuel is consumed and the cycle repeats. Ignition occurs rapidly, in milliseconds. The average time from start to finish for the engine is less than a second. Spark plugs are designed to provide a constant voltage to the combustion chamber (Ignition System) throughout the life of the engine. This class of ignition system includes the spark plug, the ignition coil, and a distributor which is not used much these days in nearly all the world except for North America and Europe where a distributor is still used. In most other countries ignition is controlled by an electronic engine management system such as Bosch, Hitachi, Nissan, Hitachi, GM, Mercedes-Benz, Suzuki, or Audi. These systems are computer based and fully automated. When the engine is running, the computer senses the need for ignition and the proper signal is transmitted to the spark plugs via distributor points or electronic ignition. A similar system is used in diesel engines. The spark is caused by electricity induced into the gap between the two electrodes. This energy creates a hot spark by breaking down the insulation on the electrodes. Most of the energy from the spark plug is
