History Photoshop was created by Apple Computer co-founder and CEO John Warnock and art director Bob Gill in the years leading up to 1984. Photoshop was the culmination of several years of research and development within the Macintosh office in Silicon Valley, California, led by Gill and Warnock, and was released to the public in 1988. Adobe Photoshop is unique among graphical editors in that it was created as a true image editor. It was not originally intended to be a "masking" tool. Adobe Photoshop began as a desktop publishing program, and the original goal of the program was to automate the rasterization of vector image information. Because of its rasterization capabilities, a prototype version of Photoshop was released in 1987 to the MacUser magazine and sold for \$495. The Macintosh version of the product was originally named ImageReady, and the product was demonstrated to MacWorld magazine. It was renamed to Photoshop (anagram of ImageReady) when Adobe acquired the program and its development group. The first version of Photoshop was shipped to Macromedia in 1989, and by 1991 it had gained a sizeable market share in the desktop publishing software market and the Macintosh market as a whole. Adobe's first release for Windows was made in 1994. Photomosaic, a feature designed to create panoramic images from a series of shots taken at differing angles, was added in 1994, followed by the popular Photoshop Filters Plug-In in 1996. A following version, Photoshop 6, was made available for Mac OS 8.5 in 1996. Also in 1996, Photoshop CS (Creative Suite), Adobe's next edition for the Mac, was made available. Image processing algorithms were added to Photoshop in 1997. This included dithering, a greyscale conversion method used to enhance the appearance of a tone-mapped image. Although computer imaging was already rapidly moving toward the future, Photoshop was the first, and among the first, to embrace the transition toward integration of photography in computer graphics. Adobe Photoshop was among the first (or even the first) to make the transition towards multipage graphics with all-digitized photography. The first 8" floppy disk version of Photoshop was shipped with Photoshop 1.0, released for Windows in October, 1988. Originally the entire program, including the user's collection of images and work, was stored on a single floppy disk. The first version that supported multi-page formats used Lexar's 8" floppy disks. Photoshop

Robert Combe Robert Combe (1728–1792) was an English engineer and inventor. Combe's main contribution to the steam engine was the adoption of the rotative condensing cylinder, which is commonly used today. He also improved the design of the lathe, grinder, and rigger, invented the coal gasometer (for atmospheric pressure gas collection) and produced an improved version of the safe. In 1775, he patented a device for braking the wheels of carriages and carts by the use of a system of horizontal pulleys. Biography Combe was born at Eyebury, Essex, son of Richard Combe, "engineer", and Elizabeth Combe. Combe first saw a fire engine at the age of eleven. Robert read the writings of philosophers like Boethius and Seneca and was deeply impressed. When he was fourteen, his schoolmaster, James Bradley, was asked to teach him and made a drawing of his life from a comment by an anonymous correspondent of the Quarterly Review. This drawing was given to Combe when Bradley died, and it was according to Bradley's wishes that this piece of memorabilia should be converted into a biography. In 1743, he was admitted to the Worshipful Company of Wheelwrights in the City of London as a journeyman. In 1746, he was apprenticed to John Gray, and after Gray's retirement the following year, he was apprenticed to his successor, Samuel Carpenter. In 1748, he was a joint-master in the fire engines of Essex, and for a short period he was their inspector, and he also attended lectures given by John Smeaton. After a dispute with the Company regarding increasing his wages, he was expelled in 1756, but his father Richard Combe allowed him to return. He was allowed to become a master wheelwright in 1766. In 1754, he married Elizabeth Wyatt, and in 1758, the couple had a daughter, Elizabeth. Elizabeth and her husband had seven daughters and five sons. Robert Combe's work could have been limited to his engineering work, but the interjections of his wife served to temper his temperamental personality. Inventions Fires Combe's first invention was a fire engine, which he built in 1752. This was the first working model of a fire engine and its main feature was the invention of a bellows that

1. Field of the Invention The present invention relates to a vehicle driving force distribution device and a method for determining optimal control coefficients in an idling air conditioner by considering the internal combustion engine rotational speed. 2. Description of the Related Art In the related art, Japanese Patent No. 3332817 proposes an idling air conditioner that is provided in a vehicle, has an engine rotational speed meter, determines whether a vehicle is in an idle state or not based on the engine rotational speed, determines whether it is convenient to operate the idling air conditioner or not based on the determination result, then distributes the force of the electric motor in such a way that the level of noise and vibration generated by the electric motor is at a level satisfying the driver's preference, and eliminates the determination result as being an error. The control coefficient of idling air conditioning is an important factor deciding the control responsiveness. In the related art, it is determined in advance, based on experience in actual tests on an actual vehicle, a control coefficient which is appropriate for the idling air conditioner depending on the vehicle type, the vehicle speed, the engine rotational speed, and the ambient air temperature. According to the invention described in Japanese Patent No. 3332817, the control coefficient of idling air conditioning is determined, based on the vehicle speed and the engine rotational speed, not only in the condition where the vehicle is in the idle state, but also in the condition where the engine is operating or when the vehicle is not operating (in the condition where the engine is in operation or is stopped) for the purpose of convenience. In addition, the control coefficient of idling air conditioning is determined, based on the engine rotational speed, only when the engine is in operation or when the vehicle is not operating. Aptamer-based fluorescence resonance energy transfer system for sensitive detection of zearalenone. A highly sensitive and specific fluorescence resonance energy transfer (FRET)-based aptamer biosensor for detection of zearalenone (ZEN) was developed by utilizing the core-immunity principle. One or two aptamers were used to capture ZEN, and the fluorescence intensity of the aptamer-ZEN complexes decreased or did not change, which could be used for direct detection of ZEN. The aptamers with a higher affinity could bind more ZEN in the construction of the aptamer-ZEN complexes, and the complexes were measured
