In this tutorial you will learn how to crop an image, change an image's brightness, contrast, color, and more with Photoshop Elements. Let's get started. 1. The first step you need to take is to get Photoshop Elements. You can download the software for free from the following link. Get Photoshop Elements If you are a user of Photoshop on a Mac or Windows computer, you will need to know that Photoshop Elements is not available in the Mac App Store or the Windows app store. Instead, you have to add it to your computer through the Adobe website. After downloading and installing the program, you will be greeted with its simple user interface. 2. Before you can begin using Photoshop Elements, you must register the software by selecting the sign up option. After selecting the option, you can then proceed to the payment page. The license you will receive is a trial license, which can be used for 30 days. After the 30-day period you will be charged \$50 per computer. To be able to work with Photoshop Elements for longer periods of time you will have to upgrade to a paid subscription. The monthly price of the software is only \$50 per month, which is cheaper than the \$100 per month price of the paid version of Photoshop. Finally, you can enjoy unlimited monthly sessions with unlimited features when you sign up for the paid version of the software. You can start working with Photoshop Elements by paying \$50 and get to work right away! 3. Q: How to find all users in a single machine, versus all users in a domain. So, I'm trying to get a list of all users on a single machine. I'm starting with IEnumerable users = User.Where(u => u.PhysicalDirectoryPath.StartsWith("c:\users")); Then I'm throwing that through an anonymous function, to produce a list of all user account names. IEnumerable accounts = from name in users.Select(u => u.UserName) select name; I then get the list of all computers from the System.DirectoryServices.DirectoryEntry object, and pass that to a function: IEnumerable userList = GetUserAccountNames(computer); IEnumerable GetUserAccountNames(DirectoryEntry computer) { return from name in computer.Properties["SAMAccountName"].Value select name; } I'm working with 5+ computer names on this list, so I'm trying to keep the function to a bare minimum. So this works for me, but it seems a lot of work to loop through everything. Is there a better way to do this, or should I be fine with using the above code in my application? A: You should take a look at the DirectorySearcher class. It was made to do exactly what you need. A: You could try to use the FindAll method of the DirectorySearcher class. Killers are scouring the world's forests looking for new sources of the deadly viruses, with an outbreak in Australia and the US provoking fresh concerns about the UK. Hendra virus and Nipah virus, two of the world's most lethal diseases, are on a par with Ebola in terms of the number of people they kill, with 500 out of 600 who get infected with each dying, according to the World Health Organisation. "It's a virus that attacks the respiratory system and they become very, very ill - there isn't a whole lot that you can do," said Dr Paul Hunter, a virologist at

Be careful: When working with the Clone Stamp, certain image areas will be disregarded. To fix it, simply drag the edges of the affected area (or select it) and the Clone Stamp will pull in the surrounding pixels. As you can see, the edges of the brush have a subtle outline. You can change the look of the outline by using various settings. Here's a method you can use to remove unwanted blemishes with the Clone Stamp: 1. Open a new document in Photoshop. 2. Select an area of your image that's going to be the subject for the Clone Stamp. 3. Choose the Clone Stamp tool. 4. Click once to establish the selection, then click again to activate the tool. 5. You'll see a border around your selection. Drag the outline of your selection to fix it. 6. Use the options in the Options bar to set how much overlap there is between the area covered by the selection and the area to be repaired. 7. Select the area to be repaired. Drag the outline to the place you want to place it. 8. Click the Commit button. You can now create a new layer to see the result. 9. The Clone Stamp is designed to copy pixels from areas inside the selection to the selected area. If you don't want the surrounding pixels copied, use the Eraser tool to clear the selected area. 10. Repeat Steps 3 to 9. 11. If you want to make more than one selection, click the Magic Wand tool and select the surrounding area. Different types of strokes are available with the Pen tool. You can use the Line tool to make straight, curved, or zigzag lines. You can use the Rectangle tool to make rectangular areas. The Eraser tool can erase pixels in an image, as well as shapes. Many of these settings are found in the Options bar (refer to Figure 9-22). You can access many of the Pen tool settings by double-clicking the Pen or Brush tool
