For the Nashville Predators, it is an opportunity to make a trade, hopefully moving up the draft board. With the 28th pick in the first round of the draft, the Predators will look to replace defenseman Seth Jones with the best available college senior. With a stacked blue line, I am hearing a lot of questions for the Predators about which college senior

paper reviews the latest advances for the treatment of chronic myelogenous leukemia (CML) patients who are resistant to or unsuitable for standard chemotherapy. We will focus on 2 new drugs that have been approved for this subset of patients. Idelalisib is the first FDA-approved drug for chronic lymphocytic leukemia, a disease of the B-cell lineage with very different molecular alterations than those found in CML. Idelalisib is a selective and reversible phosphatidylinositol 3-kinase (PI3K) delta inhibitor. This drug appears to have fewer side effects than ibrutinib. We will report the initial results with this PI3K inhibitor and its role in treating CML. The second agent is ponatinib, a TKI targeting Bcr/Abl1, T315I as well as other kinases that play a role in CML pathophysiology. In the clinical setting, ponatinib has been shown to prolong the survival of patients with CML, particularly in the first-line setting. This review will also focus on the rationale for this strategy and its preliminary results.
