Hari Kishan Engg Professor BHU Varanasi BIHAR India Abstract This paper concludes that Euler's method is a development of the difference method, which completes the development of Taylor's formalism. The Euler's method is developed in the point of view that it is a method, which is valid for finite limits. The difference method is done with an aim to achieve the definite result. In the Euler's method, the point at which the results is given is decided by restricting the method to operate between two finite limits. Euler's method is based on Taylor's theory and tries to find the points where the function is maximum or minimum. Euler's method is not only Euler's method, but was also used for the purpose of integrating continuously. The method is based on the idea of imposing an intermediate result,

---

which is an approximation to the original indefinite integral and that the intermediate result is used again in the next calculation.

The intermediate result and the method used are also shown in here. Introduction

The notion of differentiation can be seen as a simple game, but so also the notion of integration. The differentiation of a function is a kind of probability, in the sense that the probability of the function to attain a maximum (or minimum) should be considered as  $1/2$ . Integration is the reverse of differentiation. In fact this is the only criterion, in which the integration makes sense. If at any point, we take differentials, then we find the number having the property that multiplication by any constant will not change the result. If there is a unique such number, then we may write 'The differential of the function at the point of evaluation is that number' Further there can be a correspondence between the two operations, where differentiation is performed in one direction, on the contrary integration is

---

made in the other direction. A few additional definitions are shown below: A function is an expression of real variable which is denoted by  $h(t)$  The first derivative of a function Second derivative of a function Higher derivatives of a function is called the  $n$ th order derivatives of the function Differentiation is the derivative of a function Integration is the reverse of differentiation
