This will enable you to encrypt the full volume and enable you to use keys that are generated locally (Key Vault Service) and cannot be extracted from the device. The build process is available in the Windows 10 SDK to easily create IoT devices. The tooling has been designed to target smaller devices and it is focused on ARM, RISC-V, and FPGA/ASIC based devices. If you've used the older versions of Windows Embedded, you'll find that 6.0 builds on the same solid foundation as older versions. You've already got a proven platform that gives you the most stability and the most features. This improved platform shows up in all areas from your application development tools to your operating system's additional features and the expanded availability of prebuilt device support.
