## Allwinner A13 Tw A0910 V22 1126 235

Table of Contents Getting F1C200s samples Booting the F1C200s Remaining Work Resources After the success of my previous post regarding my business card that runs Linux on a diminutive Allwinner F1C100s processor, I have received a ton of good mail about it. Ive had people tell me they bought some for 61 cents (!) in moderate quantity on Taobao. Some people have asked for samples 1 . And Ive had a couple people inquire about freelance work based on this part. Allwinner A13 is an octa-core processor, the first one we have seen to use the new 64-bit ARMv8 instruction set. It has up to four low power A53 ARM Cortex cores, two or four high performance Cortex-A73 cores, and a single high performance A53 core. It also has an added NEON coprocessor. Allwinner plans to have a time-sharing model called bus-clustered in which all of the ARM Cortex cores will run at the same time, just like on a normal tablet. While this is clearly an improvement over the previous single core ARM cores, it has its own issues. For example, when one core is hard busy doing scientific calculations, it cannot perform IO on the hardware. We'll have to wait a while for this board as Allwinner wont roll out boards with the latest A13 SoC until the second half of 2016. If you want to see what it looks like, you can follow the project development with the A13\_Project thread in AllwinnerTech Communities . The Allwinner A13 has support for a full 1080P UHD video decode, and hardware acceleration for H.265 and H.264 video encoding. It also has a hardware-accelerated D-SLOW MPEG2 and AAC audio codec.

the allwinner a13-t15-b21 has a 20-watt power envelope, and uses a new package for the cpu. the package is very similar to that used in the a13-t14, and is a cmvxxx series with a size of 16-pins. the new package is produced by a separate company, although it is still based on the upm, and uses the same pin-outs and dimensions as the upm.

---

this new package is similar to that used in the beelink bamxx and it will be able to compete with the upm as a low-cost high-volume product. the allwinner a13-t15-b22 is basically a rebranding of the a13-t14-b21, so it should be identical to the a13-t14-b21 in terms of features and compatibility with linux. the only differences should be that the new cpu package is slightly different, and that it

---

will most likely be produced by a separate company and sold at a lower price. the new package is similar to that used in the beelink bamxx, although it will have lower speed and connectivity. the allwinner a13-t15-b23 has a 40-watt power envelope, and the package is very similar to that used in the allwinner a13-t15-b21, although it has a slightly different pin-out. the allwinner upm is still

---

used to deliver the chip. this soc should be a higher-end version of the upm, although it will still have a lower than normal number of pins. i also think its a great thing that you keep the external gpu driver open to your own development. i'm more or less done with my own projects for now, and looking forward to the a80. i think the allwinner a80 will be quite a good chip for the class of socs it will

---

enter. i dont think samsungs  
2nd or qualcomm's soc will  
really be that much better,  
so it should be interesting to  
see what the a80 can do.
