

Choosing the Right Frame Material for Your Glasses Is Easy With These Tips

With 61% of the population wearing glasses, many people are forced to visit the eye doctor for vision correction. But how do you know what type of frame material to select? We're going to provide a brief guide that will help you decide on frame material and ensure that they work well with your lenses and flatter you at all times.

Metal Framed Glasses:

When choosing frames, you'll need to decide on the type of metal that you'd like your frames to be made from. Before making a decision, you'll want to weigh the options carefully so that you can choose the best material for your needs. Let's get into the different types of metal used when creating metal frames for glasses. Let's take a look at the different materials that are used to create metal frames for glasses.

Beryllium: Beryllium is a cost-effective option if you're looking to stay within a specific budget. It's durable, lightweight and corrosion-resistant, so it can withstand exposure to

saltwater time after time. You'll be happy to know that there are tons of colors for you to choose from, including multicolored frames.

Flexon: When it comes to durability, Flexon beats Beryllium. Both of these materials are great for resisting corrosion, but Flexon has one other advantage over Beryllium: It's resistant to bending in various directions. The only way you can wear out your Flexon frames is by getting hit with a sledgehammer.

Titanium: Titanium is a great choice for those looking for metal frames. They're lightweight, hypoallergenic and won't cause an allergic reaction if you have children who like to play with your glasses.

Plastic Framed Glasses:

Optyl: Optyl is commonly classified as a resin because it's an epoxy resin. It's often used because it can be easily manipulated into any style or shape. This helps manufacturers to save costs when it comes to frame material, and also offers customers a wide range of styles from which to choose.

Zylonite: Zylonite is a plastic material used to make eyeglasses. It offers tons of colors for you to choose from, and it's lightweight. This makes it a great choice when you're looking to get frames for various occasions and times of the year. Zylonite is also a cheaper option than other materials, so if you're on a budget this is going to be the best choice for you.

Visit Eyecare Showroom today if you are looking for top-quality Designer Eyeglasses in North York. We have a wide selection of brands and styles, ranging from casual to sophisticated. Our friendly staff will help you find the perfect pair of designer glasses, whether it's your first-time buying glasses or you're a seasoned veteran.
